Our motto is “Contribute to the society through achieving environmental harmony”.

We are an environmental consulting company mainly specialized in environmental research and measurement certification business. We aim for the title “Environmental Navigator” by establishing a harmonious relationship between humans, as part of the ecological systems, and nature.

With our main areas of expertise being the ecological and biological systems, we are devoted to the environmental bio-business. We apply bioassay and other biotechnological methods to the environmental research, purification, and restoration.

Our inter-industrial research successfully commercialized a testing kit for endocrine disturbing chemicals using immune-chromatography. We have also a well-established track record of inventing and conducting environmental impact tests on aquatic organisms, such as fish toxicity tests, in research collaboration with other companies.

In addition to our environmental practice, we perform chemical composition analyses of various natural materials and foodstuff, especially healthy food, with the help of analysis techniques that we have developed.

**Major Product Lines**: Bio-related business: Toxicity testing using different biological species (incl. microorganisms), Environmental monitoring, and Environmental impact assessment.
