Clinical Support Corporation is a company designated as a “support institution for investigative sites” that supports the development of clinical testing for pharmaceuticals and foods.

Normally, the development of a new pharmaceutical by drug companies in test-tube, animal and human tests to obtain approval from Health, Labour and Welfare Ministry requires about 10 years and tens of billions of yen.

In fact, our company plays a specific role in supporting human clinical tests in the process of the above drug development. Toward this goal, we place emphasis on a close relationship among client drug companies and testing medical institutions. It is essential to ensure the reliability of test data.

Since the effect of a food must be scientifically validated in recent food industries, food clinical tests are increasingly performed. Under the circumstances, we would be happy if we could contribute to the development of local food industries by proactively presenting associated advice and technical expertise.
