~Offering an environmental purification system that purifies the water and air, and returns it to nature~

Our company is engaged in designing, selling and constructing an environmental purification system that employs our patented technology "circling jet flow ozone oxidation method", with a concept of low cost, high quality and a longer operation life.

The circling jet flow ozone oxidation method does not use a mechanical driving source, such as a propeller, but agitates the liquid effectively and disperses ozone gas in the waste water as minute air bubbles, accelerating the reaction between ozone and waste water. This patented technology has made degradative treatment possible that is low in cost, energy saving and effective. Our company’s principle is to consider our client’s environmental facilities as a “global environmental protection asset” and to continuously preserve them while adhering to our consistent maintenance system. Reinforcing our maintenance system with professional engineers, we are in cooperation with a major building management firm, which has 350 service bases all over the country, and have built a remote supervision emergency response system on a round the clock basis throughout the year. In the event of any trouble happening anywhere in the country, we can promptly respond to it.

Major Product Lines:
- Circling jet flow ozone treatment system (decoloration, load reduction, recycling, sludge reduction, special waste liquid)
- Ozone deodorization equipment
- Circling jet flow heavy metal treatment system (arsenic, lead, etc.)
- Functional enhancement of biological treatment plants
- Large-scale sewerage facility plants, biogas plants, etc.
